

NITHISH KADAM KADAM GANESH

(617) 415-6651 | nithishkadamganesh@gmail.com

EDUCATION

Northeastern University, Boston, MA

Sep 2024 - Dec 2026

Master of Science in Computer Science

GPA: 3.9

Relevant Coursework: Algorithms, Foundations of AI, Database Management Systems, Computer Systems, Natural Language Processing, Scalable Distributed Systems, AI Coding

TECHNICAL SKILLS

Languages: Java, C++, Go, JavaScript, TypeScript, Python, PHP, SQL

Frameworks: Spring Boot, Hibernate, Node.js, Express, React, FastAPI, JasperReports, CoreML, CreateML

Databases: PostgreSQL, OracleSQL, MongoDB, MySQL, Redis, SQLite

Cloud & Infrastructure: AWS (EC2, ECS, S3, MSK, RDS, ElastiCache), Docker, Kubernetes, Terraform, CI/CD

Tools & Messaging: Kafka, RabbitMQ, Prometheus, Grafana, Kibana, Jenkins, Git, Jira

Certifications: [AWS Certified Solutions Architect - Associate](#)

PROFESSIONAL EXPERIENCE

Wintergreen, Portland, ME, US

Jun 2025 - Dec 2025

Full-Stack Developer Intern (Node.js, Express, TypeScript, React Native, MySQL, AWS, JasperReports, PHP, Laravel)

- Architected and shipped a production end-to-end PDF reporting pipeline using Node.js/Express APIs, SQL data shaping, and JasperReports, with a React Native client for in-app preview/download, enabling automated healthcare cost reporting for HCRIS data.
- Designed and implemented RESTful APIs with third-party service integration to replace manual data workflows across legacy PHP/Laravel systems, reducing cross-system data inconsistencies and accelerating clinical data processing.
- Introduced the full reporting stack into the company from scratch, owning system design and architecture decisions across all four layers, and established deployment patterns on AWS with data validation gates at each pipeline boundary to ensure financial reporting accuracy.

Manhattan Associates, Bangalore, India

Sep 2021 - Nov 2023

Software Engineer (Java, C++, JavaScript, Hibernate ORM, Spring Boot, PL/SQL, RabbitMQ, Kibana, Grafana, Docker)

- Designed and implemented a high-throughput, event-driven message processing framework using Java/Spring Boot, C++, RabbitMQ, and PL/SQL to orchestrate real-time communication between WMS, MHE, and third-party systems, reducing end-to-end latency by 30% across all production deployments.
- Engineered complex, client-specific modifications across Waves, RF transactions, Receiving, MHE, Picking, Packing, Shipping, and Printing modules, delivering stored procedures, reports, and labels that powered warehouse operations for global enterprise clients.
- Part of a select team that led the migration of 30+ SOAP-based integrations to RESTful JSON messaging with containerized microservices, improving system modularity, API maintainability, and deployment velocity across the platform.
- Resolved 150+ production incidents across 30+ enterprise warehouse deployments spanning classic and platform versions, directly improving platform uptime, SLA compliance, and customer delivery timelines.
- Recognized with "Above & Beyond" and "Star of the Quarter" awards for consistently delivering high-impact solutions under production pressure.

Manhattan Associates, Bangalore, India

Aug 2021 - Sep 2021

Technical Analyst - Internship (Java, Hibernate ORM, Spring Boot, SQL, Shell Script)

- Developed server automation scripts in Shell and Java to eliminate manual operational tasks, improving deployment efficiency across internal infrastructure.
- Designed and implemented two RF transaction screens with a supporting navigation framework using Java and Spring Boot, improving inbound data handling throughput by 40%.

PROJECTS

AlphaWealth -  (Java, Python, C++, React, Spring Boot, FastAPI, PostgreSQL, Docker, Prometheus, Grafana)

- Architected a self-hosted, GPU-accelerated finance-AI platform of 10+ microservices across Java, Python, C++, and React — with an AI advisor that orchestrates 4 hot-swappable LLM backends (Claude, OpenAI GPT-4o, Gemini, local Ollama/Llama 3.1) over a RAG context pipeline, FinBERT for real-time news-sentiment inference (~10 ms/article on GPU), and a FinGPT-Forecaster for directional market predictions.
- Engineered a native C++ signal engine for market-regime classification (BULL/BEAR/RANGING/HIGH_VOL), a backtester with 7 built-in strategies plus a custom-strategy DSL, portfolio analytics (rebalancing planner, FIFO capital-gains, dividend projection), options analysis, and net-worth aggregation via the IBKR and Teller.io APIs — surfaced through a 9-page React workstation with per-endpoint data-integrity states (live/stale/simulated/error), containerized with Docker Compose, secured with bearer-token auth, monitored via Prometheus/Grafana, and test-gated by a GitHub Actions CI pipeline.

Arcanum The Ten Trials -   (React, Three.js, Tailwind, FastAPI, PostgreSQL, Supabase, Sentence-Transformers)

- Built and operated a production-scale, story-driven puzzle CTF platform that served 120+ registered users, sustained 90+ concurrent connections, and processed 12,000+ submissions with sub-second response times during a week-long campus-wide event at Northeastern University.
- Owned 3 of 10 trials end-to-end (concept, narrative, visual design, puzzle logic, validation) and contributed to a real-time semantic scoring engine using sentence-transformers and cosine similarity for answer proximity scoring, replacing binary feedback with a continuous temperature signal.

WarehouseFlow -  (Go, Kafka/Redpanda, Redis, PostgreSQL, Terraform, AWS ECS/MSK/RDS/ElastiCache)

- Designed, implemented, and stress-tested a fault-tolerant, horizontally scalable distributed order-routing engine provisioned with Terraform on AWS ECS, handling 5,000 orders/min at 33ms P99 latency with Kafka-backed event streaming, Redis caching, and PostgreSQL persistence, validated through 7 chaos engineering experiments achieving zero data loss on failover and 20s recovery from network partitions.
